

SekexBot for Android — Release Notes & Install Guide

Version 1.40.0 · September 28, 2026 · Runs entirely on your Android phone

SekexBot trades your Alpaca account automatically, and lets you trade by hand, from one app on your phone. It installs with one file and one command, restarts itself if Android closes it, and updates from inside the app.

What's new in 1.40.0

Change	
	Auto re-entry that jumps back in. After a profitable exit the bot (all setups, regular hours and pre-market/after-hours) gets back in on the same side in two ways: on a pullback of at least a quarter of the stock's normal range with the latest 1-minute bar turning back, or, if there is no pullback and the stock keeps running, as soon as a completed 1-minute bar closes at a new high (or low, for shorts) at least 0.3 of that range past the exit price, with the ribbon and VWAP agreeing. Up to 3 re-entries per stock in a row, within 90 minutes, never after a loss, a ribbon turn against you, a daily-loss halt or an end-of-day flatten; bought or shorted with the same take-profit-along-the-way exit. The manual auto-harvest (the button) now does the same: back in on a pullback, or after 45 seconds if it keeps running past the harvest price.
Switch	Controls > Advanced > Auto re-entry (on by default). New REENTRY trades show in the journal.

Release history (Android edition)

Version	Highlights
1.40.0	Auto re-entry that jumps back in; Switch
1.39.0	Automatic short system; Overnight homework
1.38.0	Pre-market timeline; Short at open
1.37.0	Three new tools, all off by default except the review; New command; Fixed
1.36.0	Automatic direction trading
1.35.0	Early direction call
1.34.0	Catch the morning trend and learn overnight
1.33.0	Trading levels
1.32.0	Automatic morning and night setup
1.31.0	Auto-harvest; Reopen last close

Version	Highlights
1.30.1	Publish in one command
1.30.0	Pre-open mode; Gap fade; Evening movers; Big movers list
1.29.0	Shorts on by default; Trade every flip
1.28.0	One-tap manual trading
1.27.0	Cooling off is now optional
1.26.0	Quick harvest for scalps
1.25.0	Aggressive scalping
1.24.0	Profit harvesting in every session
1.23.0	Opening Drive setup
1.22.0	Trend research
1.21.0	Trading stats
1.20.5	Charts at any hour
1.20.4	Take profit after a halt
1.20.3	Daily loss limit
1.20.2	Auto-trade safety fixes
1.20.1	Fixes
1.20.0	Paper / Live switch; Account bar
1.19.0	Interactive chart
1.18.0	Streaming prices
1.17.0	Alerts; Faster trading; Help & repair; Fixes
1.16.0	Live price everywhere, at any time
1.15.0	Suggested stop-loss / take-profit; Fix
1.14.1	Gains show green and losses red everywhere, with a + sign on gains
1.14.0	New layout with a gear
1.13.0	Double-tap to trade
1.12.1	Turn off app button uses an icon every phone font can show.
1.12.0	Full order ticket like Alpaca's
1.11.0	Manual trading

Version	Highlights
1.10.0	Fully automated install
1.9.1	Tap-to-use controls
1.9.0	Runs entirely on an Android phone inside Termux; Watchdog

What you need

Item	Details
Phone	64-bit Android, about 1.5 GB free, Wi-Fi, and a charger (keep it plugged in while it trades).
Alpaca keys	Paper Key ID and Secret (start with PK). Live keys and a Claude API key are optional.
4 free apps	From F-Droid (f-droid.org), all from the same source: Termux , Termux:API , Termux:Boot , Termux:Widget . Don't use the Play Store Termux.
Files	SekexBot_Setup.sh for a new install; SekexBot_Android_v1.40.0.zip for updating. Optional: sekexbot-setup.conf .

New install

- 1 Install the four apps from F-Droid, and open **Termux:Boot** once.
- 2 Save **SekexBot_Setup.sh** to the phone's **Download** folder.
- 3 Optional, for zero typing: fill in **sekexbot-setup.conf** (paper keys, daily limit, START_TRADING=yes) and save it in Download too. It's deleted after the install, because it holds your keys.
- 4 Open **Termux**, paste this one line, and press Enter:

```
termux-setup-storage; until [ -r /sdcard/Download/SekexBot_Setup.sh ]; do sleep 2; done;\
bash /sdcard/Download/SekexBot_Setup.sh
```

- 5 Tap **Allow** for file access. The installer then runs by itself (10–40 minutes the first time; keep the phone plugged in). It installs everything, applies your settings file, starts SekexBot, runs a setup check and opens the dashboard.

Bring over what the PC bot learned (optional): before step 4, make a folder named **SekexBot_data** in Download and copy the PC's **data** folder and **.env** file into it. Delete it afterwards.

Stop Android from closing SekexBot (do once)

Phone	Setting
All phones	Settings → Apps → Termux → Battery → Unrestricted . Same for Termux:API and Termux:Boot.
Samsung	Settings → Battery → Background usage limits → Never sleeping apps → add Termux.
Xiaomi / Redmi / POCO	Security → Permissions → Autostart → Termux on; Battery saver → Termux → No restrictions .
OnePlus / Oppo / Realme	Battery → App battery management → Termux → Allow background activity .

The setup check (sekex doctor --fix) opens Termux's battery page for you and the F-Droid page for any missing add-on.

First start

- 1 The dashboard opens at <http://127.0.0.1:8010>. In Chrome, tap **:** → **Add to Home screen** for a SekexBot icon.
- 2 If you didn't use the settings file: tap **⚙** → **Broker keys**, paste your Paper keys, then **Test connection** and **Save & connect**.
- 3 On the **Auto** tab, set your **Daily max loss** and turn on the **Auto-trader** switch.
- 4 For Start / Stop buttons on the home screen: long-press the home screen → Widgets → **Termux:Widget**.

Updating an existing install

Your version	How to update
1.12.0 or newer	In the app: ⚙ → Update . Pick the new zip from Download and tap Install, or paste your update link once and tap Install when a new version is announced.
1.11.0 or older	In Termux: sekex update ~/storage/downloads/SekexBot_Android_v1.40.0.zip (one time; after that, update from the app).

An update takes about a minute and keeps your keys, settings, learning memory and journal. Trading resumes by itself. Regular-hours positions keep their stop-loss at Alpaca meanwhile.

Using the app

Area	What it does
⚙ Layout	Tabs: Auto · Manual · Positions · More at the bottom. Auto Manual: one big switch under the header. One page: everything on one page.
⚙ Theme	Dark, Light, or Phone (follows the phone's setting).

Area	What it does
Auto	Auto-trader on/off, daily loss limit, sessions (regular, pre-market, after-hours, overnight), stock picker, bot positions, activity, what the bot learned.
Manual ticket	Buy / Sell (Short), Market, Limit, Stop, Stop limit, Trailing stop; quantity in shares or \$; Time in force (Day, GTC, IOC, FOK, At the open, At the close); session (Market hours, Extended hours, 24 Hour Market); optional stop-loss / take-profit.
Chart	Touch or drag for a crosshair (time, OHLC, volume, trend, VWAP); tap to pin a point and measure the move; pinch to zoom, double-tap to reset; 1m / 3m / 5m / 15m.
Streaming	Controls → Stream live prices: prices and P&L update tick by tick (STREAMING badge). Free plan: one stream per account.
Double-tap	Double-tap any stock in the picker, chips or positions: a quick sheet with the suggested size and BUY / SELL buttons.
Alerts	The bell icon (top right) shows the history; ⚙ → Alerts turns types on/off, quiet hours, ntfy / Telegram, price alerts.
Help	⚙ → Help & repair: Run checks, one-tap fixes, Ask AI, Send report. Also Help next to any order error.
Positions	Every position marked YOU or BOT, with Close, Close ½ and Cancel for orders; journal and daily results with totals.

Extended hours and 24 Hour Market take limit orders only. For a 24 Hour order to keep working overnight, choose **Good 'til canceled**. The bot never trades or flattens your manual positions; the daily-loss halt still closes everything in the account.

Termux commands (optional)

Command	What it does
sekex start	Start SekexBot (wake lock + auto-restart)
sekex stop	Stop the auto-trader, then the app
sekex status	Mode, state, today's P&L (green/red), battery
sekex doctor --fix	Check the phone setup and open the fix screens
sekex update <zip>	Install a newer version, keeping your data
sekex backup	Zip keys, learning memory and journal to Download (keep it private)
sekex log	Live log (Ctrl+C to quit)
sekex close SYMBOL	Close a whole position

Troubleshooting

Problem	Fix
Dashboard won't open	Tap SekexBot Start , or run <code>sekex status</code> and <code>sekex start</code> .
Stops with the screen off	Recheck the battery settings; the banner on the Auto tab should say wake lock on .
Install stops or fails	Run the same install line again, or <code>sekex setup</code> . The log is <code>~/sekexbot-install.log</code> .
Update seems stuck	Wait two minutes, then <code>sekex status</code> . The log is <code>~/sekexbot-update.log</code> .
Widget buttons missing	Install Termux:Widget from F-Droid, run <code>sekex setup</code> , then re-add the widget.
No notifications	Install Termux:API from F-Droid, allow its notifications, then ⚙️ → Alerts → Send test alert.
An order error	Tap Help next to it for a plain-language explanation.
Anything else	⚙️ → Help & repair → Run checks. Or send a screenshot of <code>sekex doctor</code> and <code>sekex log</code> .

Safety: run on paper for several weeks before going live; the simulator checks mechanics, not profitability. Use a dedicated Alpaca account. Gaps and slippage can push a loss past your limit. Your keys live on the phone; use a screen lock. Not financial advice — automated trading can lose money.
