SekexBot for Android — Release Notes & Install Guide

Version 2.49.0 · November 13, 2026 · Runs entirely on your Android phone

SekexBot trades your Alpaca account automatically, and lets you trade by hand, from one app on your phone. It installs with one file and one command, restarts itself if Android closes it, and updates from inside the app.

What's new in 2.49.0

Change
Compact Trade pad (Manual tab): the watchlist is one row you swipe sideways, a quick 5-minute chart sits beside the buttons with the entry / target / get-out lines, and the amount is three short rows (the dial is gone; presets and - / + do the same job). New at the top: Predicted direction (UP / DOWN / no lean with the Edge score, the reasons, and the price where the read flips) and Suggested size (the shares that fit your usual risk per trade to the get-out line, with a Use button, and what your current amount would risk).

Recent updates

Version	Highlights
2.48.3	Back to the US Eastern schedule: the London-open session is gone, the day…
2.48.2	Overnight recorder (Auto tab): records 8 PM - 4 AM on Sunday to Thursday…
2.48.1	One tap means one tap: no pop-ups when you buy, sell, close, flip, short,…
2.48.0	Scalp one stock (PAPER only): pick a stock and the bot takes quick 1-minute…
2.47.10	Top cards on the Edge board: you choose 3, 5, 7 or 10 stocks (remembered) · Fixed: the chart header could show one stock over another's signal card (MU…

The full list of every change is in **CHANGELOG.md** inside the app folder.

What you need

Item	Details
Phone	64-bit Android, about 1.5 GB free, Wi-Fi, and a charger (keep it plugged in while it trades).
Alpaca keys	Paper Key ID and Secret (start with PK). Live keys and a Claude API key are optional.
4 free apps	From **F-Droid** (f-droid.org), all from the same source: **Termux**, **Termux:API**, **Termux:Boot**, **Termux:Widget**. Don't use the Play Store Termux.
Files	**SekexBot_Setup.sh** for a new install; **SekexBot_Android_v2.49.0.zip** for updating. Optional: **sekexbot-setup.conf**.

New install

1. Install the four apps from F-Droid, and open **Termux:Boot** once.
2. Save **SekexBot_Setup.sh** to the phone's **Download** folder.
3. Optional, for zero typing: fill in **sekexbot-setup.conf** (paper keys, daily limit, START_TRADING=yes) and save it in Download too. It's deleted after the install, because it holds your keys.
4. Open **Termux**, paste this one line, and press Enter:

```
termux-setup-storage; until [ -r /sdcard/Download/SekexBot_Setup.sh ]; do sleep 2; done;\
  bash /sdcard/Download/SekexBot_Setup.sh
```

5. Tap **Allow** for file access. The installer then runs by itself (10–40 minutes the first time; keep the phone plugged in). It installs everything, applies your settings file, starts SekexBot, runs a setup check and opens the dashboard.

Bring over what the PC bot learned (optional): before step 4, make a folder named **SekexBot_data** in Download and copy the PC's **data** folder and **.env** file into it. Delete it afterwards.

Stop Android from closing SekexBot (do once)

Phone	Setting
All phones	Settings → Apps → Termux → Battery → **Unrestricted**. Same for Termux:API and Termux:Boot.
Samsung	Settings → Battery → Background usage limits → **Never sleeping apps** → add Termux.
Xiaomi / Redmi / POCO	Security → Permissions → **Autostart** → Termux on; Battery saver → Termux → **No restrictions**.
OnePlus / Oppo / Realme	Battery → App battery management → Termux → **Allow background activity**.

The setup check (`sekex doctor --fix`) opens Termux's battery page for you and the F-Droid page for any missing add-on.

First start

1. The dashboard opens at http://127.0.0.1:8010. In Chrome, tap ⋮ → **Add to Home screen** for a SekexBot icon.
2. If you didn't use the settings file: tap ⚙ → **Broker keys**, paste your Paper keys, then **Test connection** and **Save & connect**.
3. On the **Auto** tab, set your **Daily max loss** and turn on the **Auto-trader** switch.
4. For Start / Stop buttons on the home screen: long-press the home screen → Widgets → **Termux:Widget**.

Updating an existing install

Your version	How to update
1.12.0 or newer	In the app: ⚙ → **Update**. Pick the new zip from Download and tap Install, or paste your update link once and tap Install when a new version is announced.
1.11.0 or older	In Termux: `sekex update ~/storage/downloads/SekexBot_Android_v2.49.0.zip` (one time; after that, update from the app).

An update takes about a minute and keeps your keys, settings, learning memory and journal. Trading resumes by itself. Regular-hours positions keep their stop-loss at Alpaca meanwhile.

Using the app

Area	What it does
Tabs	Auto · Manual · Options · □ Rush · Dip calls · Positions · Radar · AI · Learn · Robinhood. Hide the ones you don't use: ⚙ → Layout.
⚙ Theme	Dark, Light, or Phone (follows the phone's setting).
Auto	Auto-trader on/off, daily loss limit, sessions (regular, pre-market, after-hours, overnight), stock picker, bot positions, activity, what the bot learned.
Manual ticket	Buy / Sell (Short), Market, Limit, Stop, Stop limit, Trailing stop; quantity in shares or $; Time in force (Day, GTC, IOC, FOK, At the open, At the close); session (Market hours, Extended hours, 24 Hour Market); optional stop-loss / take-profit.
Chart	□ Simple (default): trend banner, HH/HL/LH/LL swings, key levels, READY and EXIT lines, gamma walls. Tap □ Simple for the full chart. Pinch to zoom; 1m / 3m / 5m / 15m.
Streaming	Controls → Stream live prices: prices and P&L update tick by tick (STREAMING badge). Free plan: one stream per account.
Double-tap	Double-tap any stock in the picker, chips or positions: a quick sheet with the suggested size and BUY / SELL buttons.
Alerts	Bell icon = history. ⚙ → Alerts: ⚠ Get ready → □ Entry → □ Exit line for up to 8 stocks, on/off per type, quiet hours, ntfy / Telegram, price alerts.
Help	⚙ → Help & repair: Run checks, one-tap fixes, Ask AI, Send report. Also Help next to any order error.
Positions	Every position marked YOU or BOT, with Close, Close ½ and Cancel for orders; journal and daily results with totals.

Extended hours and 24 Hour Market take limit orders only. For a 24 Hour order to keep working overnight, choose **Good 'til canceled**. The bot never trades or flattens your manual positions; the daily-loss halt still closes everything in the account.

Termux commands (optional)

Command	What it does
`sekex start`	Start SekexBot (wake lock + auto-restart)
`sekex stop`	Stop the auto-trader, then the app
`sekex status`	Mode, state, today's P&L (green/red), battery
`sekex doctor --fix`	Check the phone setup and open the fix screens
`sekex update <zip>`	Install a newer version, keeping your data
`sekex backup`	Zip keys, learning memory and journal to Download (keep it private)
`sekex log`	Live log (Ctrl+C to quit)
`sekex close SYMBOL`	Close a whole position

Troubleshooting

Problem	Fix
Dashboard won't open	Tap **SekexBot Start**, or run `sekex status` and `sekex start`.
Stops with the screen off	Recheck the battery settings; the banner on the Auto tab should say **wake lock on**.
Install stops or fails	Run the same install line again, or `sekex setup`. The log is `~/sekexbot-install.log`.
Update seems stuck	Wait two minutes, then `sekex status`. The log is `~/sekexbot-update.log`.
Widget buttons missing	Install Termux:Widget from F-Droid, run `sekex setup`, then re-add the widget.
No notifications	Install Termux:API from F-Droid, allow its notifications, then ⚙ → Alerts → Send test alert.
An order error	Tap **Help** next to it for a plain-language explanation.
Anything else	⚙ → Help & repair → Run checks. Or send a screenshot of `sekex doctor` and `sekex log`.

Safety: run on paper for several weeks before going live; the simulator checks mechanics, not profitability. Use a dedicated Alpaca account. Gaps and slippage can push a loss past your limit. Your keys live on the phone; use a screen lock. Not financial advice — automated trading can lose money.
